The Economic Impact of the Recycling Industry in South Carolina

That recycling is beneficial for the environment is probably an uncontested proposition. What is becoming increasingly more obvious is that recycling contributes to the economic health of a state's economy. In order to better understand the economic potential of recycling to the state of South Carolina, the S.C. Department of Health and Environmental Control in conjunction with the S.C. Department of Commerce commissioned this study to measure the economic impact of recycling.

In terms of economic development, local and state governments and the public at large often think in terms of a factory, a facility, producing one identifiable product. An automotive plant, such as BMW, has a location, an identifiable product, and entry points into the facility that make it easy to quantify economic impacts. In other words, we can easily count the workers entering and leaving the plant; we can easily see the materials being delivered; and finally we can easily see the product rolling off the assembly line. Car manufacturing is categorized in the Standard Industrial Classification (SIC) system as 371, Motor Vehicle and Motor Vehicle Equipment, and in the newer North American Industrial Industry Classification System (NAICS) as 336111, Automobile Manufacturing. Recycling, however, is not so easily identified. There is no one category that captures the variety of activities that fall under recycling. Researchers have been confronted with similar problems in analyzing other amorphous industries, such as "tourism" and "retirement." Much like recycling, there is no well defined category for tourism. The economic activities associated with tourism, like recycling, are diffuse and spread across the entire region. No one wears a uniform that identifies him as an employee in the recycling industry. Analysts cannot plant themselves at a well defined location, such as a steel mill, and count workers as they enter to determine the jobs impact. Further, supply chain links are not

easily identified. The most common method to deal with these problems is to combine survey data with an impact model. This is the method we used in this research.

As the following table indicates, researchers have identified a number of industrial classifications that fall under recycling.¹

Recycling Activities and Associated SIC and IMPLAN Sector Codes²

Firm Type SIC Code IMPLAN Match Hauler-Based Collection SIC 4953 Refuse Systems IMP 446 Sanitary Services and Steam SIC 4212 Local Trucking without Supply Storage IMP 435 Motor Freight Transport and Warehousing IMP 446 Sanitary Services and Steam Disposal Facility-Based Collection SIC 4953 Refuse Systems Supply IMP 447 Wholesale Trade Recyclable Materials Wholesalers SIC 5093 Scrap and Waste Material Wholesalers SIC 4953 Refuse Systems Materials Recovery Facilities IMP 446 Sanitary Services and Steam Supply Construction and Demolition Debris SIC 4953 Refuse Systems IMP 446 Sanitary Services and Steam Processors Supply **Beneficiation Facilities** SIC 5093 Scrap and Waste Materials IMP 447 Wholesale Trade Deinked Pulp Market Producers SIC 2611 Pulp Mills IMP 161 Pulp Mills Glass Container Manufacturing SIC 2611 Glass Containers IMP 231 Glass Containers Plants Smelting and Refining Mills SIC 3341 Secondary Smelting and IMP 263 Secondary Nonferrous Metals Refining of Nonferrous Metals IMP 262 Primary Nonferrous Metals, SIC 3339 Primary Smelting and **NEC** Refining of Nonferrous Metals, Except

The first column provides commonly used descriptions of the type of industries that engage in recycling. The second column provides a match the Standard Industrial Classification (SIC) system. The third column matches the SIC categories with IMPLAN sector codes. IMPLAN, as

Copper and Aluminum

-

¹ Recycling encompasses a wide range of industrial categories which also means the supply chain links for this industry are spread across the entire state and various industries. The complete portfolio of recycling activity could be viewed as a cluster.

² Creason, Jared, and Michael Podolsky, "Upstream and Downstream Effects Using State Level Data," <u>Proceedings of the 1998 IMPLAN Users Conference</u>, Washington D.C. 1998, p. 111-120. It should be noted IMPLAN has changed codes since this paper was written. In addition, the North American Industry Classification System (NAICS) has replaced the U.S. Standard Industrial Classification (SIC) system. However, published research and many industries still refer to the SIC system and in practice many firms still identify themselves by SIC code.

we discuss later, is a model used by analysts to assess regional economic impacts. It has the advantage of being calibrated specifically to South Carolina. The important point to observe in this table is the wide range of industries that may be classified as being engaged in recycling activities.

The S.C. Department of Commerce maintains and publishes a directory of businesses that are recycling service providers. At the time of this survey, there were 340 firms listed in the directory. Our survey found that firms ranged in size from 1 employee to 553 employees. Recycling activities ranged from an artist who uses recycled materials in her art work to steel and wood reprocessing to computer recycling. E-waste (electronic waste) is one example of the dynamic and growing nature of the industry.³ The industry is also crossing borders: state and international. One company with headquarters in Florida has operations in South Carolina and collects electronic waste in South America.

The survey instrument is presented in the next section. Following that we present a summary of the results. The economic impact of recycling is then discussed. Finally, we model the economic potential of recovering recyclable Municipal Solid Waste (MSW). The appendices contain details and data used in the analyses.

Survey Analysis

Outlook Statistics

Ninety-two percent of the firms responding have an optimistic outlook on the growth of their industry. Only four firms reported that the industry is not growing. However, the recycling industry is not a homogeneous industry; i.e., it is composed of many parts that range from steel, to paper, to old computers, and so forth. One of the firms with a "no-growth" forecast reported that the industry is not growing, but the firm is expanding. This may be explained by the fact that this particular firm reports only ten percent of its employees are engaged in recycling; the rest are engaged in manufacturing unrelated to its recycling efforts. Another respondent reported that its segment of the industry is "mature." As a consistency check, we noted that this firm also does not report any expansion plans.

Eighty-four percent of the firms responding reported an average annual growth rate of twelve percent in recycling over the next five years.

The investment plans of the respondents match their outlook for the future. In other words, their expectations for the industry match their plans in their own firms. Ninety-one percent of the respondents report expansion plans. The overwhelming majority of the firms anticipate growth in the industry. At the same time, the firms are also actualizing their beliefs with tangible investment plans. The total investment within the next five years by the firms that responded is over \$365,630,000. The average investment per employee is \$90,567.

Only seven percent of the respondents reported no investment plans.⁴

Firm Size and Characteristics

The firms range in size from 1 employee to 553, with an average of 75 employees per firm. The median is 30 employees per firm.

⁴ 91% report expansion plans, 7% report no investment plans, and the remainder did not respond.

The average salary in the industry is reported to be \$32,229.⁵ The median is \$32,222. Although the range was wide, \$69,565 to \$10,000, the fact that the median is close to the average is good indicator that most firms are paying the average. These jobs are thus relatively good jobs in a state where the average salary is reported to be \$31,940 for all occupations in all industries (including professions such as medicine, law, engineering, etc)⁶

Many of the firms surveyed are multi-product firms with recycling as one component of their operations. Previous research often does not capture this fact and attributes the employment impact of the firms to recycling. In our survey we asked what percentage of the firm's business is engaged in recycling. The range of responses was as wide as possible: 1% to 100% with an average of 71%. For the purpose of determining economic impacts, the percentage of the firm's business engaged in recycling was applied to the total number of employees to determine the number of employees actually engaged in recycling. The average number of employees actually engaged in recycling activities is 48 with a median value of 14.

We also asked firms to characterize their operations into the following categories:

| Category | Number of Responses |
|-----------------|---------------------|
| Hauler | 17 |
| Processor | 30 |
| Broker | 10 |
| Manufacturer | 23 |
| Re-manufacturer | 12 |
| Reuse | 14 |

Most of the firms indicated multiple categories, indicating a high degree of multi-product activity. For example, a manufacturer may also engage in hauling and processing. And certainly, many processors have units that engage in hauling.

-

⁵ The average salary reported is the average for the firm. We are assuming the employees engaged in recycling within the firm would on average earn the average salary reported.

⁶ Nov. 2004, U.S. Department of Commerce, Bureau of Labor Statistics Occupational and Employment Survey ⁷ Previous surveys in South Carolina attributed all employees to recycling, regardless of the percentage of the business engaged in recycling. Our results are more conservative and non-comparable to the previous survey.

A total of 340 businesses was identified as being in the recycling industry in South Carolina.⁸ All firms listed were sampled. A total of 61 surveys were returned. 15 survey instruments were returned as undeliverable or having new addresses.⁹ Thus, the population of firms in the industry consists of 325 firms. The economic impact analysis uses 325 firms as the base with an average of 48 employees per firm. This implies a total employment of 15,600 in the industry.¹⁰

Multiplier Concept

The survey results provide information on what is termed a "direct impact." The direct impact is the initial spending or job generated by the firm engaged in recycling activities. In order to understand the complete economic impact of the recycling industry, we must also consider what are called "ripple effects." Ripple effects comprise indirect and induced impacts. The concept is fairly straight forward and often analysts refer to the idea of dropping a stone in a pond. The initial splash is the direct impact. The accompanying ripples are the "multiplier effects."

Consider a recycling facility. The plant hires workers and pays a payroll. The operations of the plant are the direct expenditures. In the process of its operations the firm may purchase goods and services from other companies. Those purchases are termed the "**indirect impacts**." For example, a recyclable materials processor purchases machinery from machinery manufacturers who in turn purchase raw materials, parts, and services from other industries. Further, the recyclable materials processor provides processed feedstock to other manufacturers

8

⁸ The S.C. Department of Commerce maintains and publishes a directory of businesses that are recycling service providers.

⁹ Surveys were re-sent to those firms with forwarding addresses, however, none of these were returned.

¹⁰ The total was arrived at by multiplying 48 times the population of firms, 325.

who then sell their product. The employees in turn spend their paychecks, which in turn generates additional impacts. These impacts are termed "**induced impacts**."

As an example, consider a firm engaged in Waste Management and Remediation Services. ¹¹ For every dollar of services produced, a total impact of \$1.59 is generated in the S.C. economy. ¹² The additional \$0.59 represents the ripple effects in the economy. In the normal course of operations, the company purchases gasoline to operate its trucks. Included in the \$0.59 is the purchase of gasoline to run its trucks. Also included are the gas station's purchases of utilities and supplies to run the gas station. These are the extended ripple effects and are called the indirect effects. The gas station and the firm pay wages to their employees. Their employees in turn spend money in South Carolina, such as buying hamburgers for lunch. These purchases are also captured in the multiplier and are termed the induced effects. The \$1.59 includes all impacts: direct, indirect and induced.

There is no one unique multiplier for all industries. For example, the multiplier for textiles is \$1.72. This means that for every \$1 of textile production there is a total of \$1.72 in economic activity in the State.

To determine the multiplier effects, economists utilize a regional economic impact model whose primary purpose is to determine the inter-relationships among the various sectors of an economy. Using these relationships, the ramifications of any economic activity can be traced through the linkages within the various economic sectors. The result is the "multiplier." Armed with a multiplier the researcher can determine the effects of direct spending on total economic activity, personal income and jobs. For this project, the multipliers developed by IMPLAN were

-

IMPLAN sector 460.

¹² This figure is rounded. The precise multiplier for this sector is 1.587970.

used.¹³ IMPLAN is a well recognized regional impact model that is used by many researchers.¹⁴ Since our survey was state wide, the multipliers for the state were used. IMPLAN generates three kinds of multipliers:

Output: This measures the total economic activity that takes place within the economy.

The IMPLAN multiplier for Waste Management and Remediation Services as detailed earlier is 1.59.

Income: This is commonly referred to as personal income and includes employee compensation and proprietor's income.¹⁵ The income multiplier relates \$1 of direct income to total income produced in the economy through all of the ripple effects.

Jobs: Total jobs measured as full time equivalents. The jobs multiplier is a multiple of \$1,000,000. For example, for every \$1,000,000 of services in the sector "Waste Management and Remediation Services" eleven jobs are generated in the state. Of these eleven jobs (full time equivalents), five work directly in Waste Management and Remediation Services; two work in firms that sell to this industry; and four jobs are generated by the consumer spending through the wages and salaries paid to the five workers in the industry and the two workers in the supplying firms. IMPLAN also calculates a jobs multiplier that translates direct jobs into total jobs. In this example, one job in this sector through the multiplier effect generates an additional 1.2 jobs in the state. Thus the multiplier is 2.2.

Multiplier Calculation

The previous section described how multiplier analysis is used in determining economic impacts. Where an industry is clearly defined and has an identifiable IMPLAN code, determining

¹³ Minnesota IMPLAN Group, Inc., IMPLAN System (data and software), 1725 Tower Drive West, Suite 140, Stillwater, MN 55082 www.implan.com

¹⁴ Research projects conducted at both the University of South Carolina and Clemson also use IMPLAN.

¹⁵ Employee compensation includes wages and salaries as we as benefits such as health and life insurance, retirement and non-cash compensation. IMPLAN refers to this category as labor income.

the appropriate multiplier is relatively straightforward. The problem in this industry is that recycling activities do not fall under one particular industry code. Had every firm in the state responded with an NAICS code, then each firm's impact could be determined. As is always the case with survey work, inferences must be made from limited information. Of the firms that responded, there were 15 different NAICS categories (this became 14 IMPLAN sectors). Using the employment numbers from these firms, a weighted average multiplier was constructed. In a sense, this assumes that the entire industry is distributed as the identifiable types in our sample. The weights were determined from employment numbers. ¹⁶

A total of 1935 jobs were identified by sector through our survey.¹⁷ These jobs were distributed across the industrial sectors we identified. The table below identifies the distribution of jobs:

JOBS DISTRIBUTION IN RECYCLING¹⁸

| IMPLAN | IMPLAN description | Jobs |
|--------|----------------------------------|--------|
| 39 | NEW HIGHWAYS AND STREETS | 49.50 |
| 97 | TEXTILE GOODS, N.E.C | 666.41 |
| 125 | PAPERBOARD MILLS | 135.00 |
| 152 | MISCELLANEOUS PLASTICS PRODUCT | 205.90 |
| 170 | PHOTOGRAPHIC EQUIPMENT AND SUP | 8.00 |
| 189 | GLASS AND GLASS PRODUCTS, EXC | 3.25 |
| 191 | CEMENT, HYDRAULIC | 8.63 |
| 210 | ELECTROMETALLURGICAL PRODUCTS | 135.63 |
| 220 | PRIMARY NONFERROUS METALS, N.E | 39.13 |
| 224 | IRON AND STEEL FOUNDRIES | 22.50 |
| 325 | ELECTRIC LAMPS | 5.00 |
| 390 | WHOLESALE TRADE | 587.60 |
| 460 | WASTE MANAGEMENT AND REMEDIATION | 68.5 |

_

¹⁶ This fixed proportion assumption is common in impact analysis. In fact, the Input-Output methodology assumes fixed proportions.

¹⁷ Twenty-eight firms provided either SIC or NAICS identifiers.

¹⁸ Fractional jobs are due to applying the percentage employment in recycling. For example, one firm reported 330 employees, but only 15% of the business was related to recycling. This results in 49.5 jobs attributable to recycling.

In IMPLAN terminology, these are direct jobs. The IMPLAN model takes these jobs as an input and then calculates the total impact across all sectors in South Carolina. There are twelve identifiable categories listed above. The number of jobs in each category is the input into the IMPLAN model. For example, the 68.5 jobs in category IMPLAN 460 becomes input into the IMPLAN model, and so on for the categories.. The total jobs multiplier effect of these 1935 jobs is 4,684. The jobs multiplier is then calculated to be 2.4. This means that every job in the recycling industry in South Carolina generates a total of 2.4 jobs in the state. The direct impact is 1. The indirect impact, i.e., the ripple effects from supplier firms is 0.6786. The induced impact, i.e., the impact from the spending by the employees of firms, is 0.742. For every job in the industry, an additional 1.4 jobs is created in the state through the spending patterns of supplier firms and employees spending their wages in the State.

Our survey estimated that there are 15,600 direct jobs in the state attributable to recycling activities. This implies a total jobs impact of 37,440 jobs.²¹

The labor income generated by the 1935 identifiable jobs is \$192,364,006. The labor income impact is estimated to be \$99,412 per direct job in the industry. This includes the direct pay to the employee in the industry plus all of the income generated by the indirect and induced impacts. From our survey we estimate that there are a total of 15,600 direct jobs in the industry. The total income impact is \$1.5 billion in 2005. 22

_

¹⁹ The total result, 4684, divided by 1935. For every direct job, we calculate a total of 2.4 in the state.

²⁰ This was calculated by inputting the direct jobs listed above into IMPLAN. The total result was 4,684. The jobs multiplier is calculated by dividing 4,684 by 1935, which equals 2.4. This jobs multiplier is an average multiplier. In other words, the average jobs creation in the recycling industry is 2.4. Caution must be used here. It is not correct to infer that a particular plant will generate a multiplier of 2.4. (As always, these are full time equivalents, FTE's.) $^{21} 2.4 \times 15,600 = 37,440$. The multiplier is a multiple of direct jobs.

 $^{^{22}}$ 15.600 x \$99.413 = \$1.550.842.800.

The total economic impact in State from the 1935 jobs is \$799,979,192.²³ Thus, the total economic impact per job is \$413,426. This includes the direct spending by the recycling firm (including payroll), plus the indirect spending as the firm buys goods and services within South Carolina, and the induced effects which comprise the impact of all of the payrolls connected to this chain of events. The total impact of the industry in South Carolina is not an insignificant amount: approximately **\$6.5** billion in 2005.²⁴

The recycling industry also contributes a significant tax benefit to the State.

Tax Impact
State Taxes

| | FY 99-00 | FY 00-01 | FY 01-02 | FY 02-03 | FY 03-04 |

Source: S.C. Statistical Abstract

Notes: Personal Income in FY99-00 is income as of 1999, and so on. Income tax includes personal and corporate.

The five year average ratio of Sales Tax to Personal Income is 0.0204. The five year average ratio of Income Tax to Personal Income is 0.0258. The total income impact of recycling is estimated to be \$1.5 billion in 2006 which we estimate will generate \$30,604,726 in sales taxes and \$38,674,883 in income taxes. The total tax impact on the state of South Carolina is over \$69 million.

Total impact is determined by $15,600 \times $413,426 = $6,449,445,600$.

-

²³ The total economic output is calculate by IMPLAN given the jobs numbers that were inputted into the model.

Measuring the Potential Value of Recyclable Material in Landfills

Method:

South Carolina recycled 22.4 percent of the municipal solid waste (MSW) generated in 2004. 25 Although this represents a considerable amount of recycling, the potential for greater recycling clearly exists.

What is the potential value and quantity of recyclable materials? First, we will start with the quantity. As nearly all materials that make up MSW are potentially recyclable, then approximately 100 percent of the MSW generated is recyclable. In 2004, South Carolinians generated 4.3 million tons of MSW²⁶, 72.3 percent of which was disposed in landfills²⁷, meaning the potential quantity of recyclable material disposed of in landfills is 3.1 million tons.

Estimating the value of these recyclable materials is a more difficult task. Numerous issues have arisen throughout the process, including

- the impact of increased recyclable material on the market price for recyclable materials
- the cost of increased recycling
- the makeup of the 3.1 million tons of MSW disposed of in landfills
- the lack of market data for some recyclables with small/non-existent markets

One issue not addressed in this report is the potential impact on the price of recycled materials if the potential 3.1 million tons of MSW were to be recycled. In a static market analysis, this increased supply of recyclable materials would lower the price of recyclable materials, lowering their overall value. Unfortunately, it is beyond the scope of this report to estimate this impact on the recyclable materials market. It is likely that, because the market for

²⁶ South Carolina Solid Waste Management Annual Report Fiscal Year 2004, p.3.

²⁵ South Carolina Solid Waste Management Annual Report Fiscal Year 2004, p.3.

²⁷ South Carolina Solid Waste Management Annual Report Fiscal Year 2004, p. 5.

recyclable materials is generally a regional market, and often a national market, that this 3.1 million tons would have a small impact on the price. We will assume there will be no impact on price. We justify this assumption with two arguments. The first argument is that the impact would be small in any event, while the second argument is that the overall demand for recyclable materials is increasing over time, and this increase will tend to raise prices. As we make no correction for potential future increases in demand, assuming prices will stay constant may actually be a very conservative approach to take.

The task of estimating the potential value of recyclable materials can be interpreted several ways. We have chosen to interpret our task as uncovering the market value. This value is estimated independently of the cost of recycling the materials. It is possible that the cost of recycling 100 percent of all MSW could far exceed the market value of the recycled material.

Process:

Except where noted, we used data from 2003. Ideally, to estimate the potential value of recyclable material, one would have information on the breakdown of material sent to landfills, and then could simply value that quantity with a market price. For example, if we knew that 1 million tons of aluminum were being sent to landfills each year, we could easily compute the value of that aluminum. Unfortunately, we were unable to find a direct inventory of MSW sent to landfills that broke down the MSW into categories and quantities for recyclable materials.

Lacking direct data about the quantity of recyclable materials, we had to make assumptions about how much of each category of recyclable material was currently being recycled. To do this we used information on the state's recycling rate in 2003 (28.8 percent)²⁸ and compared it to the EPA's estimate of the national recycling rate (30.6 percent)²⁹. We did this

²⁸ South Carolina Solid Waste Management Annual Report Fiscal Year 2004, p. 4

²⁹ Municipal Solid Waste Generation, Recycling and Disposal in the United States: Facts and Figures for 2003, p. 4.

because the only estimates we have for recycling rates for categories of recyclable materials were from the EPA, necessitating a translation to South Carolina data. We then adjusted the national recycling rates for each category to make them proportionate to South Carolina's overall lower recycling rate. We call the resulting proportion the recycling factor. For example, the EPA estimates that 18.8 percent of glass was recycled in 2003. Because South Carolina's recycling rate (recycling factor) is 94.1 percent of the national average, we estimated South Carolina's recycling rate for glass to be 17.7 percent (94.1 percent of 18.8 percent). Unfortunately, we have no way to verify these estimates. So although it is possible that for individual categories of recyclables South Carolina could be higher or lower than the national average (and we have no way to know if the South Carolina and national rates differ), our method assumes that the national recycling rates relates to the South Carolina rate in the same way for every category of recyclable.

We used the estimated recycling rates to calculate the percentage of each material sent to landfills and incinerated. According to SCDHEC³⁰, 93 percent of non-recycled MSW goes into landfills. We then assumed that this proportion is constant for all materials, and estimated that 93 percent of non-recycled material is sent to landfills.

Table MSW1 below shows our estimates of South Carolina's recycling rate and the quantity of recyclable materials in landfills for each major category of recyclable material. Table MSW1 also gives information on the price of each category of recyclable material, the value of that material currently being deposited in landfills, and the value of not having to landfill recycled materials. Tables MSW2 –MSW4 break this information down into narrower categories for glass, paper and plastic. From DHEC's data on the quantity of recycled material, we estimated the potential recyclable quantity, and then valued that quantity at market prices.

21

³⁰ South Carolina Solid Waste Management Annual Report Fiscal Year 2004, p.3.

Finally, because the latest price data comes from 2003, we then adjusted the market prices for inflation using the Producer Price Index. The formulas used to calculate the totals in the tables below are presented in an appendix, but a quick example may help explain our calculations. We estimated the recycling rate for steel to be 34.3 percent. In 2003, according to the South Carolina Solid Waste Management Annual Report, 13,357 tons of steel were recycled. If this quantity represents 34.3 percent of the steel produced in South Carolina, then 38,989 tons of recyclable steel were generated. Of those 38,989 tons, we estimate 23,783 tons (93 percent (the landfill rate) of the 65.7 percent (non-recycled rate = 100 percent – 34.3 percent) of the 38,989 tons) went into landfills. At a market price of \$28.50 per ton, the value of steel sent to landfills in South Carolina is \$\$679,362.80. Adjusting this for inflation, we find a final value of \$773,794.23.

We also calculated one other benefit of increased recycling: space saved in landfills. Every ton of MSW that is recycled instead of landfilled represents a cost savings. In 2004, the cost to landfill one ton of MSW was \$32. Adjusting for inflation, if all of the recyclable material in landfills had been recycled, that would have saved a total of \$30,517,361.18.

As a check on our process, we examined the total estimated weight of the recyclable material and compared that to the actual weight of the non-recycled MSW going into landfills. As Table MSW1 shows, we found that our process estimated a total weight over all six commodity classes of 889,615 tons, approximately 2.2 million tons less than the 3.1 million tons of MSW currently going to landfills. We draw two conclusions from this discrepancy. First, it seems unlikely that our process has significantly over-estimated the potential quantity of recyclable materials. As a result, our estimated value is not likely to be too high, and may be too low. Second, all MSW generated does not fit into one of the six commodity classes, and so our estimate should total less than 3.1 million tons. Unfortunately, these 2.2 million tons represents

| material | that may | be recycla | ıble, but cı | arrently lac | ks establ | lished marl | kets to be | used to | value the |

Potential Economic Impact of Landfill

The relevant number for use in IMPLAN is the "Value in Landfills," \$132,286,570. This is the input used in the appropriate IMPLAN category. The total economic potential of \$132 million in recyclable materials in landfills is \$210 million in economic output, \$71 million in personal income, and 1494 jobs. In Table MSW1, the estimated weight in landfills in S.C. is 889,615. On average, for every 1000 tons recycled from landfills represents 1.68 additional jobs in the state, a total impact of \$236,000, and generates \$79,800 in personal income. Every additional 1000 tons recycled generates \$3687 in additional tax revenues to the state.

Industry Potential

The survey results indicate that the industry anticipates a 12% annual growth rate for the next 5 years. This implies that within five years the total impact could be as high as \$11.46 billion.

Recycling is increasingly viewed as a viable and growing economic activity. In 2005, the national recycling rate for paper hit an all time high at 51.5%.³³ This represents a large increase from the 33% rate in 1990. Our survey indicates that the industry is optimistic about continued growth. As resource prices increase and as demand for resources increase, we expect that the economic impact recycling will continue to grow.

21

³¹ MSW in IMPLAN is closest to IMP 460, Waste management and remediation services.

³² The per 1000 ton impacts were calculated by dividing the total potential impact of \$132,286,570 by 889.615 (the tonnage in 1000's.)

³³ Carlton, Jim, "U.S. Paper Recycling Hits Record as Fiber Needs Grow," *Wall Street Journal*, April 12, 2006, p. A9. The article indicates that per capita, 346 pounds of paper were recycled in 2005.

APPENDIX IMPLAN TECHNICAL DETAILS

Appendix

The Input-Output Model

In this section a brief description is presented of how regional input-output models are used to estimate economic impacts. Much of the material presented here is found in a more complete exposition written by Hefner. (1997).³⁴

The primary purpose of a regional economic impact model is to determine the interrelationships among the various sectors of an economy. Using these relationships, the
ramifications of any economic activity can be traced through the linkages within the various
economic sectors. The result is what is often called a "multiplier." Armed with a multiplier the
researcher can determine the effects of an industry on total economic activity, personal income
and jobs.

There are a number of models available. The theoretical background and data for most models is an input-output model (I-O). Three I-O models that are frequently used the following:

- 1. RIMS (Regional Impact Modeling System), ³⁵ developed and maintained by the U.S. Department of Commerce;
- 2. IMPLAN (Impact Analysis for Planning), ³⁶ a model initially developed by the U.S. Department of Agriculture Forest Service and now maintained and marketed by a private firm (Minnesota IMPLAN Group, Inc); and
 - 3. REMI (Regional Economic Models, Inc.) 37 .

³⁴Hefner, Frank (1997). "Using Input-Output Models to Measure Local Economic Impacts." *International Journal of Public Administration*, 20 (8&9): 1469-1487.

³⁵ Wilbur Smith Associates, a transportation consulting firm located in Columbia, S.C., conducts transportation studies world wide and has used RIMS and REMI in their studies.

³⁶ The University of South Carolina used IMPLAN to estimate the impacts of the university and of BMW. *The Economic Impact of the University of South Carolina*, Division of Research, The Darla Moore School of Business, University of South Carolina, June 2000. The Division of Research also conducted a study on BMW, *The Economic Impact of BMW on South Carolina*, May 2002.

Imbedded in REMI and IMPLAN is an input-output model using data developed by the U.S. Department of Commerce.³⁸ In fact, all of the above mentioned models use the same basic approach: the regional multipliers and data are determined using a top-down modeling method from the national input-output tables.³⁹ For this study, the multipliers developed by IMPLAN were used.⁴⁰

The basis for impact analysis is the input-output (I-O) table. The table is constructed with data on detailed inter-industry flows throughout an economy and information on both final demands and total output. An I-O table is an accounting relationship for an entire economy (national, state, or sub-state), with each industry represented as both a column and a row in a matrix. In simple terms, it is a set of recipes for production in a given economy. The table provides data on industry demands and supplies to all industries. The multipliers that are often used are calculated from the I-O table.

A simple numerical example containing hypothetical data of a two sector economy I-O table is presented in Figure 1.

Figure 1

Hypothetical Input - Output Table

| | Con | Manu | Final Demand | Total Output |
|------|-----|------|-----------------|-----------------|
| Con | 200 | 100 | 700 | 1000 |
| Manu | 400 | 500 | 1100 | 2000 |

24

³⁷ A study (2003) conducted by the Center for Economic Forecasting at Charleston Southern University used REMI to analyze the economic impact in 2002 of the South Carolina Ports Authority .

³⁸ RIMS directly uses the Department of Commerce data.

³⁹ The technique used is referred to as "location quotients."

⁴⁰ Minnesota IMPLAN Group, Stillwater, Minnesota, 2006.

| | Con | | Manu | Final Demand | Total Output |
|-------------|--------------------------|------------------|--|----------------------------|--|
| Con Manu | $Z_{11} \\ Z_{21}$ | | $Z_{12} \\ Z_{22}$ | F_1 F_2 | $egin{array}{c} X_1 \ X_2 \end{array}$ |
| where | Con Manu Zij Xi | = = = = | construction s manufacturing intermediate d total output of | g sector lemand by indu | stry i of products from industry j |

In this example, the manufacturing sector delivers to final demand \$1100 worth of goods. Final demand is the finished product that is used by a consumer. In addition, this sector provided \$400 of output to the construction sector and \$500 to itself. The total output of manufacturing is the row total, \$2,000. From the column of manufacturing data, it is apparent that to produce the \$1100 of final goods, the manufacturing sector used \$500 worth of its own output and \$100 of output from the construction sector. These demands for goods to be used in the production of goods delivered to final demand are termed intermediate demands.

In Figure 1, the same scheme is used to obtain a general notation. The total output from each sector is the sum of the intermediate demands and the final demands, or

$$X_1 = Z_{11} + Z_{12} + F_1$$

$$X_2 = Z_{21} + Z_{22} + F_2 \\$$

which can be put into a matrix form as X = Z + F.

Figure 2
Direct Coefficients Table

Dividing the inter-industry flows by the total output produces the technical coefficients matrix, A, as seen in Figure 2. This is the set of recipes referred to earlier. An illustrative interpretation of these technical coefficients shows that it takes \$.20 worth of construction output and \$.40 worth of manufacturing output to produce \$1.00 worth of construction output.

Since total output equals the sum of the inter-industry flows and the final demand, one can derive the following equations: X = Z + F, where Z = AX. This may be solved as $X = (I - A)^{-1} F$.

Figure 3
Leontief Inverse

 $(I-A)^{-1}$ = 1.2931 0.0862 0.6897 1.3793

The term (I-A)⁻¹ is called the Leontief inverse and provides a powerful tool in I-O analysis. The numerical result of (I-A)⁻¹ in our example is found in Figure 3. To understand what these numbers mean, consider what will happen to this economy should the demand for construction increase by \$100 to \$800, while that of manufacturing remains the same. Obviously, to meet this demand, the construction sector will have to produce an extra \$100 of output. Additionally, from the I-O table one can see that construction uses construction services in its own production process. From the A matrix, we see that to produce \$1 worth of output, it takes \$.20 worth of construction production as an input. Thus, \$20 worth of construction will be needed as an input to increase output by \$100 and, to produce that \$20 worth, an additional amount given by (.2 X \$20) will be used as an input. Further, construction will demand (0.4 X \$100) from the manufacturing sector. The Leontief inverse is an effective tool for calculating the result of this round-by-round process. From the example in Figure 3, we see that a \$100 increase in the demand for construction output requires a total increase of about \$129 in construction

output and an increase of \$69 in manufacturing output. Thus the (I-A)⁻¹ matrix contains all of the direct and indirect effects of a change in final demand. The total economic impact is given by the column sums of the Leontief inverse. In our example, we find that the total economic impact of a \$1 change in construction demand is \$1.98; that is, the \$1 gets multiplied by \$1.98.

The multiplier derived from this example of the I-O model incorporates both the direct and indirect impacts. By adding to this simple model a row for payments to labor by the firm (wages) and a column of expenditure patterns (the marginal propensity to consume each type of product), the multipliers derived from the Leontief inverse will incorporate the direct, indirect, and induced impacts. The induced impacts are additional expenditures resulting from increased earnings by local residents as a result of the increase in final demand.

IMPLAN modeling software incorporates all of the sectoral impacts described above.

More importantly, the model is calibrated for South Carolina.

IMPLAN generates three kinds of multipliers:

- 1. Output: This measures the total economic activity that takes place within the economy.
- 2. Income: This is commonly referred to as personal income and includes employee compensation and proprietor's income.⁴¹
- 3. Jobs: Total jobs measured as full time equivalents. The jobs multiplier is a multiple of \$1,000,000.

-

⁴¹ Employee compensation includes wages and salaries as well as benefits such as health and life insurance, retirement and non-cash compensation. IMPLAN refers to this category as labor income.

APPENDIX

TECHNICAL DESCRIPTION

Estimating the Value of Recyclable Materials Currently Being Disposed of in Landfills

Estimating the Value of Recyclable Materials Currently Being Disposed of in Landfills

We define the following variables:

 R_{US} = the overall US recycling rate as calculated by the EPA

 R_{SC} = the overall SC recycling rate as calculated by DHEC

 $r_{i,US}$ = the US recycling rate for material i as calculated by the EPA

 $r_{i.SC}$ = the SC recycling rate for material i

No public agency directly collects data on $r_{i,SC}$, so it must be calculated from other observed data.

The ratio $\frac{R_{SC}}{R_{US}}$ we call the SC recycling factor, and assume that this factor is constant across recyclable materials. Therefore,

$$r_{i,SC} = \frac{R_{SC}}{R_{US}} \cdot r_{i,US}$$
 (Equation 1)

More definitions:

 rm_i = the quantity of material *i* recycled in SC (measured in tons)

 tm_i = the total quantity of material *i* produced in SC (measured in tons)

 lm_i = the quantity of material i deposited in landfills in SC (measured in tons)

 im_i = the quantity of material *i* incinerated in SC (measured in tons)

 nm_i = the quantity of material i not recycled (measured in tons) =

By the definition of a rate,

$$r_{i,SC} = \frac{rm_i}{tm_i}$$

which can be re-written as:

$$tm_i = \frac{rm_i}{r_{i,SC}}$$
 (Equation 2)

The total material produced in SC is disposed of in one of three ways: it is recycled, it is deposited in landfills, or it is incinerated. Therefore,

or

(Equation 3)

Re-arranging equation 3 we find:

(Equation 4)

From data produced by DHEC⁴², we know that 93% of non-recycled material is deposited in landfills. Therefore,

(Equation 5)

Substituting equation 2 into equation 4, we find:

$$nm_i = \frac{rm_i}{r_{i,SC}} - rm_i$$
 (Equation 6)

Re-arranging equation 6, we find:

$$nm_i = rm_i \left(\frac{1}{r_{i,SC}} - 1 \right)$$
 (Equation 7)

Substituting equation 6 into equation 5, we find:

$$lm_i = 0.93rm_i \left(\frac{1}{r_{i,SC}} - 1 \right)$$
 (Equation 8)

Finally, substituting equation 1 into equation 8, we find:

$$lm_{i} = 0.93rm_{i} \left(\frac{1}{\frac{R_{SC}}{R_{US}} \cdot r_{i,US}} - 1 \right)$$
 (Equation 9)

which gives us a calculation for the quantity of material *i* being deposited in landfills that can be made from known data (i.e., the quantity of recycled material, the overall US and SC recycling rates and the US recycling rate for material *i*).

The survey instrument allowed respondents to identify their firm by SIC or NAICS codes. These tables list all of the industry types from the survey. A total of 28 firms classified themselves using either SIC, NAICS, or both.

APPENDIX

IMPLAN

OUTPUT MULTIPLIERS

SOUTH CAROLINA

Copyright MIG 2006

Type I multipliers = (Direct + Indirect)/Direct

Type II multipliers = (Direct + Indirect + Induced)/ Direct

Example: Sector 32, Water, Sewage, and Other Systems the multiplier is 1.552944. For every \$1 of water or sewage system services produced, another \$0.159678 is supplied to produce this service (transportation, utilities, chemicals, and so forth). Wages are paid to the employees in Sector 32 and to all of the firms that supply inputs to this sector. As those wages are spent within South Carolina an impact of \$0.393266 is created. The sum of all of these impacts is \$1.552944.

APPENDIX

IMPLAN

INCOME MULTIPLIERS

SOUTH CAROLINA

Copyright MIG 2006

Type I multipliers = (Direct + Indirect)/Direct

Type II multipliers = (Direct + Indirect + Induced)/ Direct

Example: Sector 32, Water, Sewage, and Other Systems the income multiplier is 1.440850 For every \$1 spent to produce water or sewage system services, \$0.428644 (Direct) is in wages to the employees in that industry. Suppliers to this industry (transportation, utilities, chemicals, and so forth) paid \$0.061623 (Indirect) in wages to their employees. As those wages are spent within South Carolina, the firms that sell to these employees also pay wages amounting to \$0.617612 (Induced) an impact of \$0.393266 is created. The sum of all of these impacts is \$1.440850.

| | Description | Direct | Indirect | Induced | Total | Type I | Type II |

APPENDIX

IMPLAN

EMPLOYMENT MULTIPLIERS

SOUTH CAROLINA

Copyright MIG 2006

The Direct, Indirect, Induced, and Total Effects are per million dollars of output. For example, in Sector 32, Water, Sewage, and Other Systems, \$1,000,000 of services delivered employs 9.614435 (FTE). The supplier firms (transportation, utilities, chemicals, and so forth) employ another 1.643567 (Indirect). The spending by these employees creates additional demand in South Carolina for goods and services. This combined demand employs 4.610040 jobs (Induced).

The Type I and Type II multipliers are related to jobs. For every job in Water and Sewage services a total of 1.650439 jobs are supported in the state (the sum of direct, indirect, and induced).

Type I multipliers = (Direct + Indirect)/Direct

Type II multipliers = (Direct + Indirect + Induced)/ Direct

| Description | Direct | Indirect | Induced | Total | Type I | Type II |
|--|------------------------|----------------------|----------------------|------------------------|----------------------|----------------------|
| | Effects | Effects | Effects | Effects | Multiplier | Multiplier |
